Why Ultraformer?

Ultraformer delivers HIFU (High intensity focused ultrasound) energy below the skin. Thermal energy safely heats the skin at 3 different layers (Dermis 1.5mm, Epidermis 3mm & SMAS 4.5mm); this creates coagulation zones in the SMAS for immediate skin tightening effect, it also creates thermal damage in the dermis and deep dermis initiating formation of new collagen in the upper skin layer in 6 weeks. The skin lifting effect starts within 3 months and improves over time after that.

-  **Quick process**
Ultraformer session needs between 20 to 30 minutes only.
-  **Immediate impression**
The heat generated causes immediate skin tightening and an immediate impression that you can't miss.
-  **long lasting efficiency**
Within 6 week, the formation of new collagen in the upper skin layer begins, the new collagen generation continues for 3 months after the treatment to provide a longer-term tightening effect and continuous improvement in the appearance of the treated area.
-  **No Downtime**
Because this is a noninvasive treatment patients can go back to their daily activities immediately after the session.
-  **Tolerable treatment**
Pain and discomfort associated with the procedure are temporary, and usually occur only during the procedure.

What is Ultraformer?

Ultraformer is a new technology that uses heat generated from High Intensity Focused Ultrasound (HIFU) waves to create coagulation zones deep in the skin. Coagulation causes immediate lifting impression and triggers a collagen regeneration process, the result is noninvasive lifting of loose skin of the face and neck without any surgery.

Ultraformer's unique elliptical transducer delivers higher peak power than other standard transducers. This power enables Ultraformer to reach effective coagulation quicker, providing a faster, less painful treatment.

- Ultraformer delivers HIFU energy into three layers of the skin at 1.5mm, 3mm, 4.5mm depths
- The acoustic energy generates effective heat at focal points
- The high peak energy heats the tissue and coagulates the SMAS layer (at 4.5mm depth), this coagulation results in immediate tightening of the skin
- Heat also creates a wound healing process in the upper skin layers (1.5mm and 3mm depths) initiating a collagen regeneration process within 6 weeks from the treatment, going on throughout the 3 preceding months hence results continue to show long after that.

Ultraformer Applications

Frequently asked questions

When can I see the results?

Immediate results can be felt and seen directly, with full results to be seen in 60 to 90 days. The lifting effect stays long after that.

How long is the treatment?

A full-face treatment takes less than 20 minutes, and only one session is needed.

How does the treatment feel?

Most patients reported tolerable pain. It depends on the pain threshold of each patient.

Does having botox and fillers affect Ultraformer treatment?

No. It does not have any effect on the treatment, but it is recommended to schedule the botox and fillers procedure after the Ultraformer session.

When can I go back to normal life?

Immediately. Ultraformer is a lunchtime procedure and patients can resume their daily routine directly afterwards.
